

SkyTunnel

SkyTunnel is an industry first, cloud based service that provides hassle free connection of Integrati hardware and software over the internet.

Traditionally, the process of enabling connectivity between security devices located within a customer's Local Area Network (LAN) and remote installer software has been a major headache for system integrators. It has involved negotiating with IT departments to allow port and application access through firewalls and routers.

This can cause major delays and cost blowouts during system installations. With SkyTunnel, this process is Childsplay! If you have an Integrati controller on a customers LAN that allows internet access and you have your Integrati CS Installation software on a PC connected to the internet then connectivity between these two devices is achievable in two simple steps without touching Routers or Firewalls!

The two steps involve:

STEP 1:

Set the connection mode in the Integrati Controller to "SkyTunnel" and write down the 8 digit pin that the Controller displays

STEP 2:

Enter this 8 digit pin into the Integrati CS Software. With those two simple steps you are now connected!

How Does it work?

Most LANs allow computers or other IP enabled devices to make outgoing connections to the internet. LANs do however provide major obstacles to incoming connections from the internet. These obstacles involve firewalls and blocked ports on routers to stop unauthorised access to LANs from unknown computers on the internet. With SkyTunnel, both the Integrati controller and the Integrati software only make outgoing connections to the cloud based SkyTunnel service. The SkyTunnel service then securely and intelligently routes the data between these two connections.

Avoid the headaches of complex IT department negotiations. Skytunnel makes IP connectivity incredibly simple and will save your company valuable time and money!

SkyTunnel comes standard with Integrati ISC Controllers and all versions of Integrati Software and is one of dozens of innovative features that make Inner Range's Integrati the clear technology leader in integrated access and security.
